# Take control of your web security

Acunetix are well renowned as the pioneers in the field of automated web application security testing and as leaders of website structure analysis and vulnerability detection. However, in the security-focused world that we live in, vulnerability scanning is not enough for a large organization.

What is required is a comprehensive web application security management platform that allows the enterprise to easily find, fix and prevent vulnerabilities. Acunetix 360 is an end-to-end web security solution that offers a 360 view of an organization's security posture. It allows the enterprise to take control of the security of all its web applications, web services, and APIs, ensuring long term protection.

## End-to-end web security for your organization: **FIND, FIX, PREVENT**

### 1 FIND

- All web apps in real time
- All vulnerabilities.

### 2 FIX

- Assign to correct party
- Track progress
- Confirm resolution.

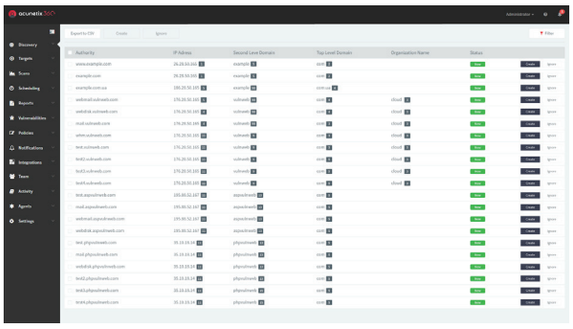
### 3 PREVENT

- Integrate into SDLC
- Prevent vulnerabilities from ever making it to production.

360 Protection

## Find all your assets

Discover all of your web and network assets and easily import all the assets that you already know. The proven scanning engine of Acunetix 360 provides the most comprehensive results in the industry and delivers them at an unbeatable speed. In just a matter of hours you'll be able to see real risks associated with your entire organization's web presence.

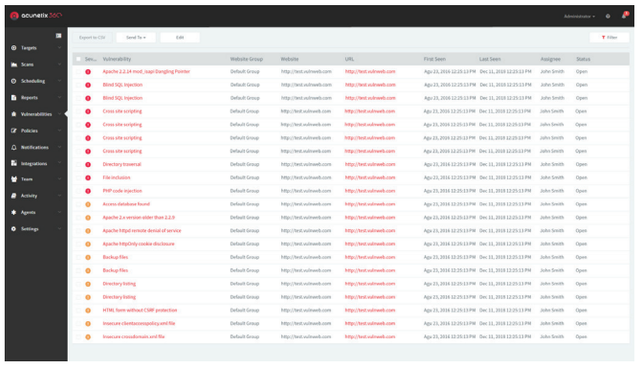


## Central management console

Acunetix 360 provides an integrated view of your company's security posture with results of all scans displayed in a central management dashboard. It provides management with historical data, trending, and prioritization reports. Acunetix 360 can also generate reports for vulnerabilities listed in PCI DSS, OWASP Top 10, ISO 27001, and HIPAA, among others.

## Fix vulnerabilities

After scanning all your web applications, web services, and APIs, you can assign results to the appropriate developer for remediation. This can be done automatically or manually. Once the responsible developer marks the vulnerability as addressed, Acunetix 360 automatically retests the vulnerability to confirm that it has in fact been fixed. If it was not, the ticket goes back to the developer to correct. If successful, the ticket goes to the manager to inform them about completion and is closed.



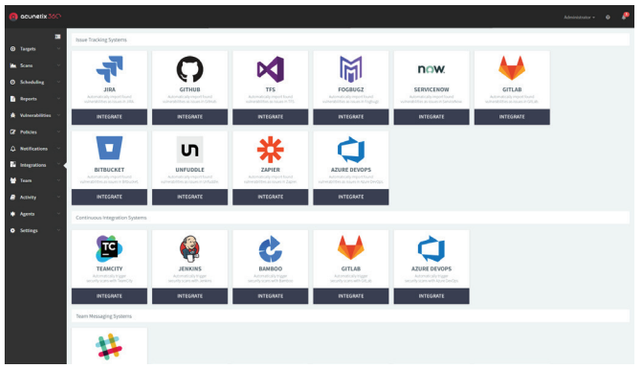
## Infinitely configurable workflows

It takes teamwork and collaboration to build and maintain an effective security program. Acunetix 360 allows you to easily set up workflows to help you address identified vulnerabilities. You can include security, development, and management teams in the process – any level of customization is possible. You may add as many users as you want with granular permissions, as well as use tools of choice such as email, slack, text, and so on.

## Out-of-the-box integrations

Acunetix 360 integrates with all the tools that fit your workflows. We build integrations for you and do not charge extra for professional services. Acunetix 360 can integrate with:

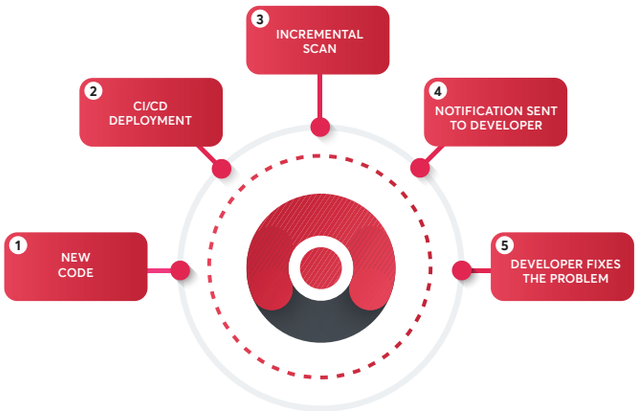
- **Issue Tracking Systems**
- **Continuous Integration Systems**
- **APIs**



## Integrate into the SDLC

By integrating into every stage of your SDLC, we allow you to become more proactive in your scanning approach. This helps you ensure that security issues are tackled at the source.

- **Catch vulnerabilities before they make it toproduction**
- **Notify developers via the tools they use**
- **Know when issues are resolved.**



"Acunetix v12 is crazy fast and the concurrent scans went way up! I could only do 10 concurrent scans before, but now I am running over double the amount concurrently. This is a huge increase in performance and capacity saving greatly on our monthly costs."

Bill F.
**Web App Service Lead, VITA**

"We use Acunetix as part of our Security in the SDLC and to test code in DEV and SIT before being promoted to Production."

Kurt Zanzi
**Information Security Office**
**Xerox CA-MMIS**
