

# ServiceV Pro

Transform the Speed of Your Software & API Development With Service Virtualization

## Design, Configure, & Deploy Virtual APIs in Just Minutes

### Enable Continuous Testing

Import a spec like OpenAPI (FKA Swagger) or record live API traffic from a REST or SOAP service to create a dynamic, "living" API. Enable continuous testing for agile development by eliminating dependencies.

### Reduce Testing Costs

Replace expensive third-party and legacy APIs that prevent proper functional and load testing of your application. Eliminate the QA bottleneck with early availability of every dependent system.

### Configure Test Data

Easily add response data, import a CSV, or connect a database for a dynamic virtualized API. Even configure network latency and server capacity to reproduce performance controls of your virtualized API.

## Eliminate Dependencies and Start Accelerating Releases

 *ServiceV Pro allows us to overcome the dependency of our core application on other internal and external services. This is key when the core application is ready for testing, but the services around the application are not.*

– Gari Gono, Solutions Architect at Zurich Insurance
